The M.pirum adhesin gene was isolated using a probe based on the 3'-end of the known M.genitalium adhesin gene. M.pirum is found in AIDS patients and the adhesin may have a role in infection of cells by HIV. If so, the M.pirum adhesin protein will be useful in vaccines to protect against the cytopathic effect of the Mycoplasma and against that of HIV. Specifically, antibodies raised against the peptides K77856 and R77857 (amino acids 201-219 and 1055-1072 of the adhesin, respectively) can inhibit infection of human cells by M.pirum and infection of human T lymphocytes by HIV.
                                                                                                                                                                                          Adhesin; cytoadherence; Mycoplasma; human immunodeficiency virus;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Nucleic acid encoding Mycoplasma pirum adhesin - and related proteins and antibodies, useful in diagnosis, treatment and prevention of M.pirum and HIV infection
                                                                                                                                                Mycoplasma pirum adhesin immunogenic peptide (1055-1072).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       deficiencies eg. myeloma, chronic articular rheumatism and endotoxin shock. Antagonist comprises BSF2 peptide (pref. AAs 20-40) with sustitutions of two or more C- and/or N-terminal AAs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                         The peptide can be used for treating inflammation and immune-mediated tissue damage such as occurs in the course of autoimmune diseases, e.g. rheumatoid arthritis. It can also be used for determining metastatic potential or to treat or prevent tumor cell metastasis. This peptide corresponds to AA 52-79 of the CD44
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  BSF2 antagonists are useful in diagnosis and treatment of immuno-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 proteins of HIV-1. The peptide provides a superior, sensitive and selective assay for the presence of antibodies to HIV-1. It may also be used as an immunogen to elicit the prodn. of anti-HIV-1 antibodies. X is the H of the N-terminal NH2 group or an additional amino acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The synthetic peptide correspond to regions of immunologically important
                                                                                                                                                                                                               The sequences given in AAR72684-89 are peptides which have an affinity to sites of inflammation. These peptides may be radioactively labelled and used for imaging inflammation sites as diagnostic agents. Tests on rats showed that these peptides would be safe at levels upto 1000 times the recommended clinical dose, The peptides were found to accumulate at sites of inflammation and remain there long enough to allow effective imaging.
                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                5,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Synthetic peptide antigens for detection of HIV-1 infection also useful as immunogens in vaccine compsns.

This sequence represents an immunogenic portion of a Mycobacterium
tuberculosis antigen of the invention. The polypeptides are useful for
tuberculosis antigen of the invention. The polypeptides are useful for
immunotherapy to treat or prevent tuberculosis (especially in humans),
e.g. they can be included with an acceptable carrier in pharmaceutical
compositions or included in vaccines, and administered to induce
protective immunity in a patient against M. tuberculosis. Tuberculosis is
a chronic, infectious disease generally caused by M. tuberculosis is
infection, and if left untreated typically results in serious
complications and death. Fusion proteins containing the antigen, or DNA
molecules can similarly be included with an acceptable carrier in
pharmaceutical compositions or in vaccines and administered as above. The
polypeptides are also useful for diagnosis of tuberculosis, by contacting
dermal cells with at least one polypeptide and detecting an immune
response (especially induration) on the patient's skin. Inhibiting the
spread of tuberculosis requires vaccination and accurate diagnosis, since
antibiotic therapy may not be effective due to the existence of an
symptomatic but contagious stage and to patient non-compliance. The
polypeptides overcome concerns of safety and efficacy of current
vaccination with live bacteria (usually Bacillus Calmette-Guerin) and
lack of sensitivity and specificity of existing diagnostic techniques.
                                                                                                                                                                                                                                                                             ;;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Antigen; M.tuberculosis protein; immunotherapy; tuberculosis; diagnosis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This sequence represents an ammunogente political of a myconoctation to the formation of the invention. The polypeptides are useful for immunotherapy to treat or prevent tuberculosis (especially in humans), and they can be included with an acceptable carrier in pharmaceutical compositions or included in vaccines, and administered to induce protective immunity in a patient against M. tuberculosis. Tuberculosis a chronic, infections disease generally caused by M. tuberculosis is infection, and if left untreated typically results in serious complications and death. Fusion proteins containing the antigen, or DNA molecules can similarly be included with an acceptable carrier in pharmaceutical compositions or in vaccines and administered as above. The polypeptides are also useful for diagnosis of tuberculosis, by contacting dermal cells with at least one polypeptide and detecting an immune response (especially induration) on the patient's skin. Inhibiting the spread of tuberculosis requires vaccination and accurate diagnosis, since antibiotic therapy may not be effective due to the existence of an

AAX97916 to AAX98029 represent 110 isolated human secreted protein genes. AAY3624 to AAX36727 represent the secreted proteins encoded by the 110 human genes. The genes and their corresponding secreted polypeptides are useful for preventing, treating or ameliorating medical conditions, e.g. by protein or gene therapy. Also pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new genes. Specific uses are described for each of the 110 genes, based on which tissues they are most highly expressed in, and include developing products for the diagnosis or treatment of cancer, tumours, developmental abnormalities and foetal deficiencies, blood disorders, diseases of the immune system, autoimmune diseases, inflammation, allergies, Alzheimer's and cognitive disorders, schizophrenia, arthritis, asthma, psoriasis, sepsis, skin disorders, atherosclerosis, diabetes, cardiovascular
                                                               Human; secreted protein; cancer; tumour; developmental abnormality; foetal deficiency; blood disorder; immune system disorder; inflammation; autoimmune disease; allergy; Alzheimer's disease; cognitive disorder; schizophrenia; arthritis; asthma; psoriasis; sepsis; skin disorder; atherosclerosis; diabetes; cardiovascular disorder; kidney disorder; digestive disorder; endocrine disorder; infection; AIDS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New isolated human genes encoding secreted polypeptides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Ferrie AM, Florence C;

The present invention relates to new nucleic acid sequences and the proteins encoded by the nucleic acid sequences. The encoded proteins comprise an immunogenic portion of a Chlamydia antigen. The encoded proteins are useful for the serodiagnosis and treatment of Chlamydia infection. Chlamdiae are intracellular bacterial pathogens that are responsible for a wide variety of human infections. C. trachomatis infection is one of the most common sexually transmitted diseases and can lead to pelvic inflammatory disease (PID), resulting in tubal obstruction and infertility. Trachoma due to ocular infection with C. trachomatis is the leading cause of preventable blindness worldwide. C. pneumonia is a major cause of acute respiratory tract infections in humans and is also
                                                                                                                                                                                                                                                                                                               thought to play a role in the pathogenesis of atherosclerosis and coronary heart disease. The present sequence is a protein isolated in the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                  The present peptide is provided in a specification relating to compounds and methods for the treatment and diagnosis of chlamydial infection. The compounds provided include polypeptides and fusion proteins comprising immunogenic portions of Chlamydia antigens and DNA sequences encoding such polypeptides. They are useful for vaccinating against chlamydial infection, which causes pelvic inflammatory disease, trachoma, acute respiratory tract infections, atherosclerosis and heart disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ä

Peptide Protein

```
Ab007571-AAD07645 represent CDNAs corresponding to 25 human secreted protein genes, and AAE03052-AAE03126 represent the proteins they encode. AAE03127-AAE03150 represent human secreted protein fragments. The genes and their corresponding secreted proteins are useful for preventing, treating or ameliorating medical conditions are useful for preventing, the therapy. Pathological conditions can be diagnosed by determining the amount of the new protein in a sample or by determining the presence of mutations in the new genes. Specific uses are described for each of the include developing products for the diagnosis or treatment of proliferative disorders, cancer, tumours, foetal and developmental abnormalities, haematopoietic disorders, diseases of the immune system, allergies, neurological disorders, diseases of the immune system, allergies, neurological disorders (e.g., Alzheimer's disease, cardiovascular disorders (e.g., Alzheimer's disease, eardiovascular disorders, pregnancy-related disorders, endicorders, eardiovascular disorders, pregnancy-related disorders, endicorders, endicorders, and infections. The proteins can also be used to aid wound subnum, to maintain organs before transplantation, for supporting cell contained and infections before transplantation, for supporting cell contained by and in the company transplantation, to prevent skin a be used contained and addition or procents, and in the company transplantation, to maintain organs before transplantation, for supporting cell contained by addition or and in the company transplantation, to maintain organs before transplantation, to resent be used to and used to a bused and addition or and and addition to maintain organs and in the company transplantation because by and in the company transplantation and and the company transplantation because by the company transplantation because the contained by and the company transplantation because the contained by and the company transplantation because the contained by and the contained by and the contained by a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Antibodies specific for a protein of the invention can be used in alleviating symptoms associated with the disorders mentioned above, and in diagnostic immunoassays e.g., radioimmunoassay or enzyme linked immunosorbent assay (ELISA). The present sequence represents a human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                         Nucleic acids encoding 25 human secreted polypeptides, useful for preventing, diagnosing and/or treating e.g. Gaucher's disease, Alzheimer's disease, Scinitar syndrome, Creutzfeldt-Jacob disease, diabetes mellitus and multiple sclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            as a food additive or preservative to modify storage properties.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           qq
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to new nucleic acid sequences and the proteins encoded by the nucleic acid sequences. The encoded proteins comprise an immunogenic portion of chlamydia antigen. The encoded proteins are useful for the serodiagnosis and treatment of Chlamydia infection. Chlamdiae are intracellular bacterial pathogens that are responsible for a wide variety of human infections. C. trachomatis infection is one of the most common sexually transmitted diseases and can lead to pelvic inflammatory disease (PID), resulting in tubal obstruction and infertility. Trachoma due to ocular infection with C. trachomatis is the leading cause of preventable blindness worldwide. C. pneumonia is a major cause of acute respiratory tract infections in humans and is also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           thought to play a role in the pathogenesis of atherosclerosis and coronary heart disease. The present sequence is a protein isolated in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Isolated polypeptide for diagnosis and treatment of Chlamydia infection comprises immunogenic portion of Chlamydia antigen, which comprises amino acid sequence encoded by polynucleotide sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Stromberg EJ;

                                                                                                                                                                                                                                                                                      Gaps
The present peptide is provided in a specification relating to compounds and methods for the treatment and diagnosis of chlamydial infection. The compounds provided include polypeptides and fusion proteins comprising immunogenic portions of chlamydia antigens and DNA sequences encoding such polypeptides. They are useful for vaccinating against chlamydial infection, which causes pelvic inflammatory disease, trachoma, acute respiratory tract infections, atherosclerosis and heart disease.
                                                                                                                                                                                                                                                                                      ï

The present invention describes an agonist (A) of apolipoprotein A-I (apoA-I) which is a 15-29 residue peptide, or analog, that forms an amphipathic alpha-helix in presence of lipids. (A), and their lipid complexes, are used to treat or prevent diseases associated with dyslipidemia, specifically hypercholesterolaemia, cardiovascular disease, atherosclerosis, restenosis, HDL (high density lipoprotein) or apoA-I deficiency; hypertholesterolamia and metabolic syndrome, also for treating septic shock. When labeled, (A) can also be used diagnostically to measure serum levels of HDL, in particular the HDL subpopulation that is involved in retrograde cholesterol transport, also to image HDL at e.g. atherosclerotic streaks, and to raise antibodies. AAY1941 represent lecithin.cholesterol acyltransferase (LCAT) activity exhibiting core peptides, which are apoA-I agonists.
                                                                                                                                                                                                                                                                                     Metz G;
                                                                                                                                                                                                                                                                                  Buttner K, Cornut I, Dasseux J, Dufourcq J,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 223,

"Primary structure and biological activity of bradykinin potentiating peptides from Bothrops insularis snake venom.";
J. Protein Chem. 9:221-227(1990).
-!- FUNCTION: THIS PEPTIDE BOTH INHIBITS THE ACTIVITY OF THE ANGIOTENSITY-CONVERTING ENZYME AND ENHANCES THE ACTION OF BRADXKININ BY INHIBITING THE KINASES THAT INACTIVATE IT.

IT ACTS AS AN INDIRECT HYPOTENSIVE AGENT.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

This invention describes an immunoassay method where a sample with a specific binding entity (e.g. a monoclonal antibody) reactive to human inducible nitric oxide synthase (1NOS) or mimics of this protein is used to detect the presence of human 1NOS protein in the sample. The method can be used for the detection and quantitation of human 1NOS in cells and tissues for various pathophysiological conditions such as sepsis, septic shock, myocardial infarction, rejection of tissue in organs following transplantation, monitoring "flare ups" in certain autoimmune diseases such as lupus, psoriasis, and multiple sclerosis. This sequence represents a synthetic peptide analogue of human neuronal nitric oxide synthase (nNOS) which is used in the method of the invention.
                                                                                                                                                                                                                    Inducible; nitric oxide synthase; iNOS; human; immunoassay; detection; monoclonal antibody; mimic; quantitation; sepsis; septic shock; lupus; myocardial infarction; tissue rejection; transplantation; psoriasis; autofimmune disease; multiple sclerosis; neuronal; nNOS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Detection of human inducible nitric oxide synthase - using an immunoassay in which a sample is contacted with a specific binding entity reactive with human INOS or mimics.
                                                                                                                                                                                Synthetic human nNOS amino-terminal peptide analogue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Score 32.5; DB 19;

The peptide can be used for treating inflammation and immunemediated tissue damage such as occurs in the course of autoimmune diseases, e.g. rheumatoid arthritis. It can also be used for determining metastatic potential or to treat or prevent tumor cell metastasis. This peptide corresponds to AA 77-97 of the CD44
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The peptide can be used for treating inflammation and immune-mediated tissue damage such as occurs in the course of autoimmune diseases, e.g. rheumatoid arthritis. Cyclic peptide inhibitor of LFA-1/ICAM-1 interaction #12.

Sequence

Length 16;

```
The sequence represents the amino acid sequence of cyclic peptide inhibitor #28 of lymphocyte function associated antigen-1 and intracellular adhesion molecule (LFA-1/TCAM-1) interaction. A composition comprising a cyclic peptide inhibitor of LFA-1/TCAM-1 interaction is useful for treating haematopoietic neoplastic disease, myocardial infarction, radiation injury, asthma, rheumatoid arthritis or lymphoma metastasis. The composition is also useful for inhibiting in a subject the interaction between LFA-1 expressed on a leukocyte and ICAM-1 expressed on another cell, preventing retinoic acid syndrome in a subject receiving all-trans retinoic acid, inhibiting growth of leukaemia cells, inhibiting emigration of leukocytes from blood into tissue and screening a candidate compound for binding to ICAM-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Composition comprising a cyclic peptide inhibitor of lymphocyte function associated antigen-1 and intracellular adhesion molecule 1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Ricin; toxin; antiviral; virucide; retrovirus; protease; HTLV-I;

A composition comprising a cyclic peptide inhibitor of LFA-1/ICAM-1 interaction is useful for treating haemacopoletic neoplastic disease, myocardial infarction, radiation injury, asthma, rheumatoid arthritis or lymphoma metastasis. The composition is also useful for inhibiting in a subject the interaction between LFA-1 expressed on a leukocyte and ICAM-1 expressed on another cell, preventing retinoic acid syndrome in a subject inhibiting all-trans retinoic acid, inhibiting growth of leukaemia cells, inhibiting emigration of leukocytes from blood into tissue and screening a candidate compound for binding to ICAM-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Composition comprising a cyclic peptide inhibitor of lymphocyte function associated antigen·1 and intracellular adhesion molecule interaction, for treating e.g. asthma and myocardial infarction -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The sequence represents the amino acid sequence of cyclic peptide
                        Cyclic; lymphocyte function associated antigen-1; LFA-1; asthma; intracellular adhesion molecule; ICAM-1; inhibitor; leukaemia; haematucpoietic neoplastic disease; myocardial infarction; radiation injury; rheumatoid astatifitis; lymphoma metastasis; retinoic acid syndrome; all-trans retinoic acid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Cyclic; lymphocyte function associated antigen-1; LFA-1; asthma; intracellular adhesion molecule; ICAM-1; inhibitor; leukaemia; haematopoietic neoplastic disease; myocardial infarction; radiation injury; rheumatoid arthritis; lymphoma metastasis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                  ..
                                                                                                          This claimed peptide is a cleavage recognition site for a HTLV-I protease. It is utilised as a linker between the A and B chains of a ricin-like protein in a novel recombinant protein. A nucleic acid (see AAT97910) encoding such a construct is obtained by PCR mutagenesis of the wild-type ricin linker sequence. The invention provides novel recombinant proteins which incorporate the A and B chains of a ricin-like toxin (preferably the A and B chains of ricin) linked by a heterologous linker sequence containing a cleavage recognition site for a retroviral protease such as HIV protease (see AAW36880-8Z), HTLV-I (see AAW36885-65). The recombinant proteins selectively inhibit or destroy mammalian cells infected with a retrovirus such as cancer cells associated with HTLV or cells associated with HTLV or cells associated from the B chain by a retroviral protease, and thus can be used to specifically target infected cells without the need for a cell binding component.
                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                          DNAs encoding ricin like toxins A and B - are linked via linker containing cleavage site for retroviral protease, used to inhibit or destroy mammalian cells infected with retrovirus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     encoding human agrin and muscle specific kinase - used in diagnosis and treatment of disorder

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes a chimeric polypeptide (A1), comprising ann osteoprotegerin (OPG) dimerisation domain fused to a heterologous amino acid sequence. Also described are: (1) a multimer polypeptide comprising covalently associated A1 monomers; (2) an isolated nucleic acid encoding A1; (3) an expression vector comprising the nucleic acid sequence; and (4) a host cell transformed or transfected with the expression vector so that the nucleic acid is expressible. The products from the present invention are useful to treat a variety of disorders including those related to receptor binding. Compositions comprising tumour necrosis factor (TNF)/OPG and TNF receptor (TNFR)/OPG chimeras are used to treat TNF and TNFR-mediated disorders such as inflammation, autoimmune diseases and disorders related to excessive apoptosis. The chimeras are also useful for detecting molecules which interact with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   fused heterologous sequences to identify potential new receptors and ligands. The present sequence represents a TNFR N-terminal peptide from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Tumour necrosis factor receptor 1; TNFR-1; inhibitor; osteoprotegerin; OPG; chimeric; fusion; dimerisation domain; autoimmune disease; inflammation; apoptosis.
                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New chimeric osteoprotegerin polypeptides - contain the osteoprotegerin dimerisation domain and a heterologous sequence, useful to treat TNF and TNFR-mediated disorders
This peptide sequence comprises the first 18 amino acids of the chick muscle specific kinase (MuSK) cytoplasmic domain. It was used to raise polyclonal antibodies for MuSK. These were used in studies that demonstrated that agrin (see AAW26609) induces prominent and rapid tyrosine phosphorylation of MuSK (see also AAW26610-11).
                                                                                                                                                                                                                                                        ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes a chimeric polypeptide (A1), comprising am no steeportegerin (OPG) dimerisation domain fused to a heterologous amino acid sequence. Also described are: (1) a multimer polypeptide comprising covalently associated A1 monomers; (2) an isolated nucleic acid encoding A1; (3) an expression vector comprising the nucleic acid expenses; and (4) a host cell transformed or transfected with the expression vector so that the nucleic acid is expressible. The products from the present invention are useful to treat a variety of disorders functualing those related to receptor binding. Compositions comprising tumour necrosis factor (TNE)/OPG and TNF receptor (TNFR)/OPG chimeras are used to treat TNF and TNFR-mediated disorders such as inflammation,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     autoimmune diseases and disorders related to excessive apoptosis. The chimeras are also useful for detecting molecules which interact with fused heterologous sequences to identify potential new receptors and ligands. The present sequence represents a TNFR N-terminal peptide from

                                                       The present invention describes a chimeric polypeptide (A1), comprising an osteoprotegerin (OPG) dimerisation domain fused to a heterologous amino acid sequence. Also described are: (1) a multimer polypeptide comprising covalently associated A1 monomers; (2) an isolated nucleic acid encoding A1; (3) an expression vector comprising the nucleic acid sequence; and (4) a host cell transformed or transfected with the expression vector so that the nucleic acid is expressible. The products
                                                                                                                                                                                                                                                                                                                                                                                            autoimmune diseases and disorders related to excessive apoptosis. The chimcras are also useful for detecting molecules which interact with fused heterologous sequences to identify potential new receptors and ligands. The present sequence represents a TNFR N-terminal peptide from
                                                                                                                                                                                                                                                                       from the present invention are useful to treat a variety of disorders including those related to receptor binding. Compositions comprising tumour necrosis factor (TWF)/OPG and TWF receptor (TWFR)/OPG chimeras are used to treat TWF and TWFR-mediated disorders such as inflammation,
